```
List all the environments
> conda info —envs

List all the packages installed
> conda list

Create a dedicated environment
> conda create —n dscsulb python=3.6

Check that it has been installed
> conda info —envs

Install a package in the new environment
> conda install —n dscsulb numpy

Install multiple packages in the environment
> conda install —n dscsulb scikit-learn scipy

Activate environment to touch only that one
> source activate dscsulb

And then simply download in it
> conda install pandas

Use can use pip too
> pip install seaborn

Deactivate an environment
> source deactivate
```
